Introduction

In this session, we'll cover the fundamentals of Java programming and get started with writing our first Java programs.

Setup and Installation

To start working with Java, you need to install the JDK (Java Development Kit):

1. Download JDK from Oracle's website
2. Install JDK on your system
3. Configure environment variables (JAVA_HOME, PATH)

Your First Java Program

```
public class HelloWorld {  
    public static void main(String[] args) {  
        System.out.println("Hello, World!");  
    }  
}
```

Code Explanation

- `public class HelloWorld`: Defines a public class named HelloWorld
- `public static void main(String[] args)`: The main method - entry point of the program
- `System.out.println()`: Prints output to the console

Compiling and Running

To compile and run your program:

```
javac HelloWorld.java  
java HelloWorld
```

Data Types in Java

Primitive Data Types

```
// Integer types
int age = 25;
long population = 7000000000L;

// Floating-point types
float price = 19.99f;
double pi = 3.14159265359;

// Character type
char grade = 'A';

// Boolean type
boolean isStudent = true;
```

Reference Types

```
String name = "John Doe";
String[] courses = {"Java", "Python", "C++"};
```

Operators

Arithmetic Operators

```
int a = 10;
int b = 3;

int sum = a + b;      // Addition: 13
int diff = a - b;     // Subtraction: 7
int product = a * b;  // Multiplication: 30
int quotient = a / b; // Division: 3
int remainder = a % b; // Modulus: 1
```

Comparison Operators

```
int x = 5;
int y = 10;

boolean isEqual = (x == y);      // false
boolean isNotEqual = (x != y);   // true
boolean isGreater = (x > y);     // false
boolean isLess = (x < y);        // true
```

Control Flow Statements

if-else Statement

```
int score = 85;

if (score >= 90) {
    System.out.println("Excellent");
} else if (score >= 70) {
    System.out.println("Good");
} else {
    System.out.println("Pass");
}
```

for Loop

```
for (int i = 1; i <= 5; i++) {
    System.out.println("Number: " + i);
}
```

while Loop

```
int count = 0;
while (count < 5) {
    System.out.println("Count: " + count);
    count++;
}
```

Lab Exercises

1. Write a program that takes two numbers from the user and prints their sum
2. Write a program that checks if a number is even or odd
3. Write a program that prints numbers from 1 to 10

Summary

In this session, we covered:

- Structure of a Java program
- Data types (primitive and reference)
- Operators (arithmetic and comparison)
- Control flow statements (if-else, for, while)
